PREFACE

INTRODUCTION

The *CINAHL Subject Headings* list contains all the terms currently used to provide subject access in the **Cumulative Index to Nursing & Allied Health Literature** and the Nursing & Allied Health (CINAHL) database.

The National Library of Medicine's Medical Subject Headings (also known as MeSH) was used as the model for the CINAHL thesaurus. Like MeSH, the CINAHL list organizes index terms in three separate sections — an alphabetic list, a tree structure or hierarchical list, and a permuted list.

More than 6,800 CINAHL subject headings provide direct, specific access to the literature of nursing and allied health. Annual updates to the Subject Heading List maintain its currency and relevancy.

Recognizing the authoritativeness of NLM's vocabulary, CINAHL accepts Medical Subject Headings as the standard thesaurus for diseases, drug names, and anatomical/physiological concepts. Nearly all CINAHL headings in those areas follow MeSH. Overall, approximately 70% of CINAHL headings are also MeSH terms. However, CINAHL supplements these terms with 2,000+ unique headings designed specifically for nurses and allied health professionals. This blending of MeSH and CINAHL is intended to provide researchers with the best of both worlds — the familiarity and consistency of a standard terminology, and the strong subject orientation of a specialized thesaurus.

Adopting the tree structure format developed by the National Library of Medicine for MeSH enhanced the power of the CINAHL thesaurus for database searching. The hierarchical structure of the "trees" identifies broader and narrower headings and allows searchers to "explode" multiple related headings with a single command. In order to facilitate cross-database searching, CINAHL has used MeSH tree numbers where possible, and identified unique numbers with a dollar sign ($).

The addition of the *Permuted List* in 1990 makes it even easier to locate relevant subject terms. This list is an alphabetic index of all significant terms appearing in a CINAHL subject heading or cross reference.

CINAHL's goal for 1993 and beyond is to make the thesaurus as user-friendly as possible. Toward this end, numerous term definitions and indexing guidelines have been added. Once again, CINAHL is greatly indebted to the National Library of Medicine. Many of the definitions for MeSH terms have been derived from scope notes originally appearing in the MeSH vocabulary file.

Database searchers are also well served by CINAHL's thesaurus revision policy. Each revised heading is automatically mapped from the deleted term to the new term at the beginning of the indexing year. History notes in the thesaurus alert users to the fact that the new terms are searchable electronically for past years.

CINAHL's editorial team is committed to the development of a thesaurus that accurately and comprehensively reflects the literature of nursing and allied health. Obviously, this is a never-ending task. Every year the editorial committee reviews hundreds of suggestions for new headings, cross references, and scope notes. Many of these suggestions come from users of the print index or electronic database. We very much appreciate this feedback, and hope you will work with us on an ongoing basis to make the *CINAHL Subject Headings* list the best it can be.

ALPHABETIC LIST

The *Alphabetic List* contains all CINAHL subject headings and their cross references arranged in alphabetical order. Citations will be found in the subject section of CINAHL only under the headings that appear in large type. All other entries are cross references leading the user to authorized CINAHL headings.

Cross references are of two types:

1) **See** references refer from terms not used to valid CINAHL headings. In most cases, the term referred from is synonymous to the preferred term. The references appear in lower case and the preferred CINAHL term in upper case, e.g.,

   Bonding, Parent-Infant see **PARENT-INFANT BONDING**

   The "x" symbol listed under a valid CINAHL heading indicates a backwards see reference, e.g.,

   PARENT-INFANT BONDING
   x Bonding, Parent-Infant

2) **See also** references indicate related CINAHL headings which generally do not appear in the same tree, e.g.,

   HOSPITALIZATION
   see also CHILD, HOSPITALIZED

   The "XX" symbol indicates a backwards see also reference, e.g.,

   CHILD, HOSPITALIZED
   XX HOSPITALIZATION

Each heading is followed by one or more alphanumeric codes (tree numbers) which direct the user to the place(s) in the *Tree Structures* where the term is to be found. A dollar sign ($) preceding the tree number indicates either that the heading does not also appear in Medical Subject Headings (MeSH) or that it appears in a different position within the MeSH tree structures. A plus sign (+) following the tree number indicates that there are additional terms indented under that heading in the *Tree Structures*.

Three different types of notes may appear in the thesaurus record:

1) The date identifies what year a term was added as a subject heading.

2) The history note explains where to find information on that topic in previous years.

3) The scope note provides a brief definition of the heading and/or explains the use of subheadings.

The following is a complete sample entry from the *Alphabetic List:*

WARMING TECHNIQUES
$E2.990
Year: 1992

Techniques used to prevent or treat loss of body heat. They may include warming intravenous fluids and irrigation solutions to body temperature, heating bed linens, warming and humidifying anesthetic gases, protecting the body surface from exposure to air currents, etc.

Searchable electronically since 1983.

x Body Warming Techniques
Rewarming Techniques
XX HYPOTHERMIA

TREE STRUCTURES

The *Tree Structures* list all the CINAHL headings in a subject hierarchy. The trees are composed of 16 broad categories (e.g., Category A = Anatomy) most of which are divided further into subcategories (e.g., Subcategory A7 = Anatomy-Cardiovascular System). The CINAHL terms in each subcategory are arranged hierarchically according to their alphanumeric codes (tree numbers) from the most general to the most specific. Each CINAHL term appears in at least one place in the trees and may appear in as many additional places as are logically appropriate.

CINAHL indexers routinely use the most specific headings available to represent indexable concepts. For example, articles on nurse practitioners working with the elderly will be indexed only under the specific heading GERONTOLOGIC NURSE PRACTITIONERS. They will *not* also appear under the general term NURSE PRACTITIONERS. The CINAHL user who neglects to look up the heading NURSE PRACTITIONERS in the trees may easily miss the more specific, relevant headings indented underneath it.

CINAHL has made limited see also references between headings that appear in the same tree; consequently, examination of the *Tree Structures* is the most accurate way to identify many specific headings of interest. Any CINAHL heading that has been assigned a tree number followed by a plus sign (+) should be looked up in the trees since there will be specific headings indented beneath it. CINAHL users may also consult the trees to find additional subject headings that express related concepts whether at the same level, or at higher or lower levels of specificity.

In the *Tree Structures*, each term is followed by a number that indicates its position in the hierarchy. It may also be followed by one or more additional numbers in smaller type that indicate other tree locations for the same heading. These cross reference tree numbers are truncated to the third level.

The trees also contain some terms that are designated (NON-CINAHL). These are included solely for the purpose of clarifying the logical structure of the tree. They are *never* used for indexing and do not appear in the subject section of CINAHL.

The following is a sample section from the *Tree Structures:*

PERMUTED LIST

The *Permuted List* is an alphabetic index of every significant word appearing in a CINAHL subject heading or cross reference. Each entry includes that word in bold print either all upper case (if a subject heading) or upper and lower case (if a cross reference):

ADULT **NURSE** PRACTITIONERS
Anesthetists, **Nurse** *see* NURSE ANESTHETISTS
Attitudes, **Nurse** see NURSE ATTITUDES
Authors, **Nurse** see NURSE AUTHORS
CLINICAL **NURSE** SPECIALISTS
Consultants, **Nurse** see NURSE CONSULTANTS
Consultants, **Nurse** Legal see NURSE LEGAL CONSULTANTS
EDUCATION, **NURSE** ANESTHESIA
EDUCATION, **NURSE** MIDWIFERY
FAMILY **NURSE** PRACTITIONERS
GERONTOLOGIC **NURSE** PRACTITIONERS
NEONATAL **NURSE** PRACTITIONERS
NURSE ADMINISTRATORS

Each segment of a hyphenated term is normally considered as one word. For example, the heading EDUCATION, POST–RN is listed under both POST and RN as well as EDUCATION. However, a few exceptions have been made for terms in which one segment is meaningless without the other, e.g. X-RAYS. Non-significant terms — articles, conjunctions, some prepositions — are not entries. Single letters, Arabic numbers, and Roman numerals are included, however. Entry terms are listed in alphabetical order with Arabic numbers at the end.

The *Permuted List* has a variety of uses:

1) A searcher can locate the appropriate main heading when only one word of the heading is known. For example, the entry term Chemolysis will lead the user to INTERVERTEBRAL DISK CHEMOLYSIS, the authorized CINAHL heading.

2) It provides a link between headings and cross references which might be related but which do not necessarily appear together in either the *Alphabetic List* or the *Tree Structures*. For example, under the entry term INFANT, one finds such potentially useful headings as PARENT-INFANT BONDING; INFANT, HIGH RISK; and SUDDEN INFANT DEATH. No relationship between these terms is suggested elsewhere in the thesaurus.

3) It displays headings which would be retrieved when doing a text word search in the CINAHL database, and thus allows searchers to identify potential "false drops." For example, a searcher using the term "ventilation" to find articles on mechanical ventilation might be unpleasantly surprised to retrieve information on MIDDLE EAR VENTILATION. Judicious use of the *Permuted List* can help to prevent the retrieval of irrelevant citations.

SUBHEADINGS

TOPICAL SUBHEADINGS

There are 51 topical subheadings (or secondary headings) that can be linked to CINAHL main headings to increase the specificity of indexing. These subheadings help to group together articles on a particular aspect of a topic. Not all subheadings can be used with all main headings; for example, the subheading /prevention and control is meaningless linked to the main heading NURSING PROTOCOLS. The subcategories of main headings with which a particular subheading can be combined are identified in parentheses in the list that follows. GEOGRAPHICS

GEOGRAPHIC NAMES can be used both as subject headings and subheadings. A complete list of the geographics appears in the alphabetic and tree structures (Category Z) of the Subject Heading List.

TERTIARY HEADINGS

A second group of subheadings is called tertiary headings. They are distinguished from the topical subheadings (or secondary headings) in two ways. First, they can either be linked directly to a CINAHL main heading OR they can be linked to the end of a main heading/topical subheading combination. For example:

REHABILITATION NURSING/Great Britain or
REHABILITATION NURSING/Education/Great Britain.

And second, they can be used in combination with any CINAHL main heading as appropriate.

These tertiary headings fall into two basic subcategories — age groups and geographic headings. Age group exceptions /in pregnancy and /in utero function like other age group headings.

AGE GROUPS

IN ADOLESCENCE - Used for occurrence during adolescence, 13 to 18 years.

IN ADULTHOOD - Used for occurrence during adulthood, 19 to 44 years.

IN INFANCY AND CHILDHOOD - Used for occurrence during infancy and childhood, birth to 12 years.

IN MIDDLE AGE - Used for occurrence during middle age, 45 to 64 years.

IN OLD AGE - Used for occurrence during old age, 65 years+.

IN PREGNANCY - Used for occurrence during pregnancy, from conception through puerperium.

IN UTERO - Used for occurrence within the uterus from conception to birth.

A method of delineating blood vessels by subtracting a tissue background image from an image of tissue plus intravascular contrast material that attenuates the x-ray photons. The background image is determined from a digitized image taken a few moments before injection of the contrast material. The resulting angiogram is a high-contrast image of the vessel. This subtraction technique allows extraction of a high-intensity signal from the superimposed background information. The image is thus the result of the differential absorption of x-rays by different tissues.

$E2.831.578.900.450 $G11.427.394.380.450
Year: 1983
A form of active exercise that increases muscle tension by applying pressure against stable resistance. This may be accomplished by opposing different muscles in the same individual, as by pressing the hands together or by making a limb push or pull against an immovable object. There is no joint movement and the length of the muscle remains unchanged, but muscle strength and tone are maintained or improved.

MYOCARDIAL ISCHEMIA
C14.280.647 C14.907.553.470
Year: 1993
A disorder of cardiac function caused by insufficient blood flow to the muscle tissue of the heart. The decreased blood flow may be due to narrowing of the coronary arteries, to obstruction by a thrombus, or, less commonly, to diffuse narrowing of arterioles and other small vessels within the heart.
Before 1993 see under CORONARY DISEASE; ISCHEMIA.

MYOCARDIAL REPERFUSION
E4.752.700.600 E5.680.730.600
Year: 1990
Generally, restoration of blood supply to heart tissue which is ischemic due to decrease in normal blood supply. The decrease may result from any source including atherosclerotic obstruction, narrowing of the artery, or surgical clamping. Reperfusion can be induced to treat ischemia. Methods include chemical dissolution of an occluding thrombus, administration of vasodilator drugs, angioplasty, catheterization, and artery bypass graft surgery. However, it is thought that reperfusion can itself further damage the ischemic tissue, causing MYOCARDIAL REPERFUSION INJURY.
x Reperfusion, Myocardial

MYOCARDIAL REPERFUSION INJURY
C14.280.600.615 C14.907.553.700.600
C23.814.763.530
Year: 1991
Functional, metabolic, or structural changes in ischemic heart muscle thought to result from REPERFUSION to the ischemic areas. Changes can be fatal to muscle cells and may include edema with explosive cell swelling and disintegration, sarcolemma disruption, fragmentation of mitochondria, contraction band necrosis, enzyme washout, and calcium overload. Other damage may include hemorrhage and ventricular arrhythmias. One possible mechanism of damage is thought to be oxygen free radicals. Treatment currently includes the introduction of scavengers of oxygen free radicals, and injury is thought to be prevented by warm blood cardioplegic infusion prior to reperfusion.
